Needs legal review.	`privacy` ironstandard.no/privacy/	SEO TITLE Privacy and Cookies | Iron Standard META DESCRIPTION 145 CHARACTERS How Iron Standard collects, uses and protects personal data from website enquiries, your rights under GDPR, and how this website handles cookies.	`privacy.html`
08	**Terms and Accessibility** Linked in the footer. Needs legal review.	`terms` ironstandard.no/terms/	SEO TITLE Terms and Accessibility | Iron Standard META DESCRIPTION 136 CHARACTERS The terms for using the Iron Standard website, how facility information is presented while it is built, and our accessibility statement.	`terms.html`

Paste the SEO title and meta description into the page's SEO plugin fields (Yoast or Rank Math). The 404 page is not a normal page: build it under Elementor › Theme Builder › Single › 404 using `404.html`, or leave the theme default.

SETTING UP EACH PAGE

1. Pages › Add New. Use the page title and slug from the table (the slug is under Permalink or in the right-hand panel).
2. Page Attributes › Template: **Elementor Canvas**. The HTML carries its own header, menu and footer, so the theme's must be switched off or they will show twice.
3. Edit with Elementor, drag in one **HTML** widget, paste the page's code, update.
4. Fill in the SEO title and meta description from the table.
5. Home only: Settings › Reading › Your homepage displays › A static page › Home.
6. Settings › Permalinks must be set to **Post name** so the slugs read `/about/`, not `?page_id=12`.
7. Check the old coming-soon page is unpublished or its slug changed, so it does not take `home` or `/`.

LINK AND FILE MAP

IN THE SITE FILES		ON WORDPRESS
`index.html`	→	`/`
`about.html`	→	`/about/`
`facility.html`	→	`/facility/`
`coaching.html`	→	`/coaching/`
`coaching.html#one-to-one`	→	`/coaching/#one-to-one`
`faq.html`	→	`/faq/`
`contact.html`	→	`/contact/`

The code needs one conversion before pasting. The current files link to each other as `about.html` and load their images, styles and scripts from a relative `assets/` folder. On WordPress those paths break. The paste-ready version swaps every link for its slug and points every file at one uploaded folder, as in the map on the right.

IN THE SITE FILES		ON WORDPRESS
`contact.html?type=coaching#enquiryForm`	→	`/contact/?type=coaching#enquiryForm`
`privacy.html`	→	`/privacy/`
`terms.html`	→	`/terms/`
`assets/…`	→	`/wp-content/uploads/iron-standard/assets/…`

FILES TO UPLOAD ONCE

Upload the `assets` folder by FTP or the host's file manager to `/wp-content/uploads/iron-standard/assets/`. Every page loads the same `site.css`, `motion.css`, `site.js` and `motion.js` from there; the homepage also loads `home.css` and `home.js`.

ENQUIRY FORM

Works unchanged inside WordPress. Once the Google Apps Script is deployed, paste its URL into the Contact page code where it says `PASTE_WEB_APP_URL_HERE`.
